

# PageRank computation

Lecture 11, October 8, 2019

See the Excel file for the computations.

## Exercise #2

Compute the PageRank values for the following graph for three iterations using  $q = 0.5$ .

Figure 1: Web graph for Task 1

## Algorithm

- All pages are given equal page rank  $\frac{1}{T}$  (where  $T$  is the number of pages)
- Substitute the values and compute new PageRank values using Equation 1
- Repeat for the required number of iterations

$$PR(a) = \frac{q}{T} + (1 - q) \sum_{i=1}^n \frac{PR(p_i)}{L(p_i)} \quad (1)$$

## Solution

Page	$L(p)$	Iteration 0	Iteration 1	Iteration 2	Iteration 3
A	2	0.333	0.333	0.375	0.354
B	1	0.333	0.250	0.250	0.260
C	1	0.333	0.417	0.375	0.385

Table 1: PageRank values.

Remember that you need to consider the **incoming** links of a page.

E.g., for iteration 2, node C:

$$PR(C) = \frac{0.5}{3} + (1 - 0.5) \left( \underbrace{\frac{0.333}{2}}_{\text{from A}} + \underbrace{\frac{0.25}{1}}_{\text{from B}} \right)$$

## Exercise #3

Compute the PageRank values for the following graph for three iterations using  $q = 0.15$ .

Figure 2: Web graph for Task 2

## Algorithm

- All pages are given equal page rank  $\frac{1}{T}$  (where  $T$  is the number of pages)
- Substitute the values and compute new PageRank values using Equation 2
- Repeat for the required number of iterations
- Notice that node 2 is a rank sink (no outgoing links); pretend that it links to all other nodes (including itself)

$$PR(a) = \frac{q}{T} + (1 - q) \sum_{i=1}^n \frac{PR(p_i)}{L(p_i)} \quad (2)$$

## Solution

Page	$L(p)$	Iteration 0	Iteration 1	Iteration 2
1	2	0.167	0.096	0.082
2	6	0.167	0.167	0.123
3	3	0.167	0.119	0.089
4	2	0.167	0.261	0.281
5	2	0.167	0.167	0.193
6	1	0.167	0.190	0.230

Table 2: PageRank values.

We pretend that page 2 links to all other pages (including itself), hence  $L(p) = 6$  there.
